

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A process for manufacturing a liquid crystal panel wherein liquid crystal is filled between a pair of substrates, comprising the following steps:

marking a specified figure on one of the substrates, ~~which consists of a line extending in parallel with one edge of the liquid crystal encapsulation opening;~~

forming a seal pattern on the substrate marked with the specified figure, forming a seal pattern further comprising:

detecting the specified figure ~~on one such substrate,~~

determining a start point and an end point in relationship to the specified figure, and

applying sealing material from the start point to the end point according to a predetermined pattern, ~~and providing wherein the predetermined pattern provides~~ a liquid crystal encapsulation opening in the vicinity of ~~marking the specified figure;~~

joining one substrate with the other substrate as to be paired together;

cutting the joined substrates to obtain the pair of substrates;

injecting liquid crystal material through the liquid crystal encapsulation opening of the pair of substrates thus obtained; and

closing the liquid crystal encapsulation opening.

2. (Canceled)

3. (Original) The process for manufacturing a liquid crystal panel according to claim 1, wherein the specified figure consists of two lines that extend in parallel with one edge of the liquid crystal encapsulation opening, and are arranged between both ends of the sealing material.

4. (Currently amended) A process for manufacturing a liquid crystal panel wherein liquid crystal is filled between a pair of substrates, comprising the following steps:

marking a specified figure on one of the substrates ~~which consists of a line extending in parallel with one edge of the liquid crystal encapsulation opening;~~

applying a sealing material on one ~~such of the~~ substrates according to a predetermined pattern ~~specified for each of the pair of substrates, and the predetermined pattern~~ providing a liquid crystal encapsulation opening;

joining one substrate with the other substrate as to be paired together;

cutting the joined substrates to obtain the pair of substrates;

detecting the positions of the specified figure and the liquid crystal encapsulation opening; ~~and;~~

~~selecting the a pair of substrates where the seal material is normally applied, the selecting based on the position of the liquid crystal encapsulation opening with respect to the specified figure having one end of the sealing material within a predetermined range;~~

~~injecting liquid crystal material through the liquid crystal encapsulation opening of the selected pair of substrates thus obtained; and~~

~~closing the liquid crystal encapsulation opening.~~

5. (Canceled)

6. (Original) The process for manufacturing a liquid crystal panel according to claim 4, wherein the specified figure consists of two lines that extend in parallel with one edge of the liquid crystal encapsulation opening, and are arranged between both ends of the sealing material.

7. (Currently amended) A liquid crystal panel comprising:

a first substrate;

~~a specified figure that is formed on one side of one the first substrate and consists of a line extending in parallel with one edge of the liquid crystal encapsulation opening;~~

sealing material that is applied to the first substrate from a start point to an end point, the start point and end point at predetermined positions with respect to the specified figure, a space between the start point and the end point providing to provide a liquid crystal encapsulation opening in the vicinity of the specified figure;

a second substrate whose side is joined to the first substrate by means of the sealing material;

liquid crystal material that is encapsulated between the pair of substrates; and

a closing member for closing the liquid crystal encapsulation opening.

8. (Canceled)

9. (Currently amended) The liquid crystal panel according to claim 7, wherein the specified figure consists of two lines that extend in parallel with one edge of the liquid crystal encapsulation opening, and are arranged between ~~both ends of the start point and the end point~~ of the sealing material.

10. (New) A liquid crystal panel comprising:

a first substrate having a specified figure formed on one side;

sealing material formed on the first substrate, the sealing material providing a liquid crystal encapsulation opening in the vicinity of the specified figure;

a second substrate whose side is joined to the first substrate by means of the sealing material;

liquid crystal material that is encapsulated between the pair of substrates; and

a closing member for closing the liquid crystal encapsulation opening,

wherein the sealing material is formed by the process comprising:

detecting the specified figure;

determining a start point and an end point in relation to the specified figure; and
applying sealing material from the start point to the end point according to a predetermined pattern, wherein the predetermined pattern provides the liquid crystal encapsulation opening in the vicinity of the specified figure.

11. (New) The liquid crystal panel according to claim 10, wherein the specified figure consists of two lines that extend in parallel with one edge of the liquid crystal encapsulation opening, and are arranged between the start point and the end point of the sealing material.
